Hi Paul,

It was good to finally meet you in person. I know everyone was somewhat concerned with using the lead action level for making risk-based decisions, given that it is not a health-based number, so I wanted to follow up with you on that.

Attached is a study conducted in Canada which was not in the batch of documents I sent you previously, but it has useful and relevant information specific to lead in drinking water and lead service lines. I am also attaching a poster developed by U.S. EPA on modeling the impact of short-term lead exposure on blood lead levels in children with drinking water specific information. I hope this information helps.
